

**NAME**

CPAN::Kwalify - Interface between CPAN.pm and Kwalify.pm

**SYNOPSIS**

```
use CPAN::Kwalify;
validate($schema_name, $data, $file, $doc);
```

**DESCRIPTION**

`_validate($schema_name, $data, $file, $doc)`

`$schema_name` is the name of a supported schema. Currently only `distroprefs` is supported. `$data` is the data to be validated. `$file` is the absolute path to the file the data are coming from. `$doc` is the index of the document within `$doc` that is to be validated. The last two arguments are only there for better error reporting.

Relies on being called from within `CPAN.pm`.

Dies if something fails. Does not return anything useful.

`yaml($schema_name)`

Returns the YAML text of that schema. Dies if something fails.
