

## NAME

Sys::Syslog - Perl interface to the UNIX syslog(3) calls

## VERSION

Version 0.22

## SYNOPSIS

```
use Sys::Syslog;                                # all except setlogsock(),
or:
use Sys::Syslog qw(:DEFAULT setlogsock);        # default set, plus
setlogsock()
use Sys::Syslog qw(:standard :macros);          # standard functions, plus
macros

openlog $ident, $logopt, $facility;              # don't forget this
syslog $priority, $format, @args;
$oldmask = setlogmask $mask_priority;
closelog;
```

## DESCRIPTION

Sys::Syslog is an interface to the UNIX syslog(3) program. Call `syslog()` with a string priority and a list of `printf()` args just like `syslog(3)`.

You can find a kind of FAQ in *THE RULES OF SYS::SYSLOG*. Please read it before coding, and again before asking questions.

## EXPORTS

Sys::Syslog exports the following Exporter tags:

- `:standard` exports the standard `syslog(3)` functions:  
`openlog closelog setlogmask syslog`
- `:extended` exports the Perl specific functions for `syslog(3)`:  
`setlogsock`
- `:macros` exports the symbols corresponding to most of your `syslog(3)` macros and the `LOG_UPTO()` and `LOG_MASK()` functions. See *CONSTANTS* for the supported constants and their meaning.

By default, Sys::Syslog exports the symbols from the `:standard` tag.

## FUNCTIONS

### **openlog(\$ident, \$logopt, \$facility)**

Opens the syslog. `$ident` is prepended to every message. `$logopt` contains zero or more of the options detailed below. `$facility` specifies the part of the system to report about, for example `LOG_USER` or `LOG_LOCAL0`: see *Facilities* for a list of well-known facilities, and your `syslog(3)` documentation for the facilities available in your system. Check *SEE ALSO* for useful links. Facility can be given as a string or a numeric macro.

This function will croak if it can't connect to the syslog daemon.

Note that `openlog()` now takes three arguments, just like `openlog(3)`.

**You should use `openlog()` before calling `syslog()`.**

### **Options**

- `cons` - This option is ignored, since the failover mechanism will drop down to the console automatically if all other media fail.
- `ndelay` - Open the connection immediately (normally, the connection is opened when the first message is logged).
- `nofatal` - When set to true, `openlog()` and `syslog()` will only emit warnings instead of dying if the connection to the syslog can't be established.
- `nowait` - Don't wait for child processes that may have been created while logging the message. (The GNU C library does not create a child process, so this option has no effect on Linux.)
- `perror` - Write the message to standard error output as well to the system log.
- `pid` - Include PID with each message.

### Examples

Open the syslog with options `ndelay` and `pid`, and with facility `LOCAL0`:

```
openlog($name, "ndelay,pid", "local0");
```

Same thing, but this time using the macro corresponding to `LOCAL0`:

```
openlog($name, "ndelay,pid", LOG_LOCAL0);
```

### **syslog(\$priority, \$message)**

#### **syslog(\$priority, \$format, @args)**

If `$priority` permits, logs `$message` or `sprintf($format, @args)` with the addition that `%m` in `$message` or `$format` is replaced with `"$!"` (the latest error message).

`$priority` can specify a level, or a level and a facility. Levels and facilities can be given as strings or as macros. When using the eventlog mechanism, priorities `DEBUG` and `INFO` are mapped to event type `informational`, `NOTICE` and `WARNIN` to `warning` and `ERR` to `EMERG` to `error`.

If you didn't use `openlog()` before using `syslog()`, `syslog()` will try to guess the `$ident` by extracting the shortest prefix of `$format` that ends in a `":"`.

### Examples

```
syslog("info", $message);           # informational level
syslog(LOG_INFO, $message);         # informational level

syslog("info|local0", $message);     # information level,
Local0 facility
syslog(LOG_INFO|LOG_LOCAL0, $message); # information level,
Local0 facility
```

### Note

Sys::Syslog version v0.07 and older passed the `$message` as the formatting string to `sprintf()` even when no formatting arguments were provided. If the code calling `syslog()` might execute with older versions of this module, make sure to call the function as `syslog($priority, "%s", $message)` instead of `syslog($priority, $message)`. This protects against hostile formatting sequences that might show up if `$message` contains tainted data.

### **setlogmask(\$mask\_priority)**

Sets the log mask for the current process to `$mask_priority` and returns the old mask. If the mask argument is 0, the current log mask is not modified. See *Levels* for the list of

available levels. You can use the `LOG_UPTO( )` function to allow all levels up to a given priority (but it only accept the numeric macros as arguments).

### Examples

Only log errors:

```
setlogmask( LOG_MASK(LOG_ERR) );
```

Log everything except informational messages:

```
setlogmask( ~(LOG_MASK(LOG_INFO)) );
```

Log critical messages, errors and warnings:

```
setlogmask( LOG_MASK(LOG_CRIT) | LOG_MASK(LOG_ERR) |  
LOG_MASK(LOG_WARNING) );
```

Log all messages up to debug:

```
setlogmask( LOG_UPTO(LOG_DEBUG) );
```

### setlogsock(\$sock\_type)

**setlogsock(\$sock\_type, \$stream\_location)** (added in Perl 5.004\_02)

Sets the socket type to be used for the next call to `openlog( )` or `syslog( )` and returns true on success, undef on failure. The available mechanisms are:

- "native" - use the native C functions from your `syslog(3)` library (added in Sys::Syslog 0.15).
- "eventlog" - send messages to the Win32 events logger (Win32 only; added in Sys::Syslog 0.19).
- "tcp" - connect to a TCP socket, on the `syslog/tcp` or `syslogng/tcp` service.
- "udp" - connect to a UDP socket, on the `syslog/udp` service.
- "inet" - connect to an INET socket, either TCP or UDP, tried in that order.
- "unix" - connect to a UNIX domain socket (in some systems a character special device). The name of that socket is the second parameter or, if you omit the second parameter, the value returned by the `_PATH_LOG` macro (if your system defines it), or `/dev/log` or `/dev/conslog`, whatever is writable.
- "stream" - connect to the stream indicated by the pathname provided as the optional second parameter, or, if omitted, to `/dev/conslog`. For example Solaris and IRIX system may prefer "stream" instead of "unix".
- "pipe" - connect to the named pipe indicated by the pathname provided as the optional second parameter, or, if omitted, to the value returned by the `_PATH_LOG` macro (if your system defines it), or `/dev/log` (added in Sys::Syslog 0.21).
- "console" - send messages directly to the console, as for the "cons" option of `openlog( )`.

A reference to an array can also be passed as the first parameter. When this calling method is used, the array should contain a list of mechanisms which are attempted in order.

The default is to try `native`, `tcp`, `udp`, `unix`, `stream`, `console`. Under systems with the Win32 API, `eventlog` will be added as the first mechanism to try if `Win32::EventLog` is available.

Giving an invalid value for `$sock_type` will croak.

### Examples

Select the UDP socket mechanism:

```
setlogsock("udp");
```

Select the native, UDP socket then UNIX domain socket mechanisms:

```
setlogsock(["native", "udp", "unix"]);
```

#### Note

Now that the "native" mechanism is supported by `Sys::Syslog` and selected by default, the use of the `setlogsock()` function is discouraged because other mechanisms are less portable across operating systems. Authors of modules and programs that use this function, especially its cargo-cult form `setlogsock("unix")`, are advised to remove any occurrence of it unless they specifically want to use a given mechanism (like TCP or UDP to connect to a remote host).

#### `closelog()`

Closes the log file and returns true on success.

## THE RULES OF SYS::SYSLOG

*The First Rule of Sys::Syslog is:* You do not call `setlogsock`.

*The Second Rule of Sys::Syslog is:* You **do not** call `setlogsock`.

*The Third Rule of Sys::Syslog is:* The program crashes, dies, calls `closelog`, the log is over.

*The Fourth Rule of Sys::Syslog is:* One facility, one priority.

*The Fifth Rule of Sys::Syslog is:* One log at a time.

*The Sixth Rule of Sys::Syslog is:* No `syslog` before `openlog`.

*The Seventh Rule of Sys::Syslog is:* Logs will go on as long as they have to.

*The Eighth, and Final Rule of Sys::Syslog is:* If this is your first use of `Sys::Syslog`, you must read the doc.

## EXAMPLES

An example:

```
openlog($program, 'cons,pid', 'user');
syslog('info', '%s', 'this is another test');
syslog('mail|warning', 'this is a better test: %d', time);
closelog();
```

```
syslog('debug', 'this is the last test');
```

Another example:

```
openlog("$program $$", 'ndelay', 'user');
syslog('notice', 'fooprogram: this is really done');
```

Example of use of `%m`:

```
$! = 55;
syslog('info', 'problem was %m');    # %m == $! in syslog(3)
```

Log to UDP port on `$remotehost` instead of logging locally:

```
setlogsock('udp');  
$Sys::Syslog::host = $remotehost;  
openlog($program, 'ndelay', 'user');  
syslog('info', 'something happened over here');
```

## CONSTANTS

### Facilities

- LOG\_AUDIT - audit daemon (IRIX); falls back to LOG\_AUTH
- LOG\_AUTH - security/authorization messages
- LOG\_AUTHPRIV - security/authorization messages (private)
- LOG\_CONSOLE - /dev/console output (FreeBSD); falls back to LOG\_USER
- LOG\_CRON - clock daemons (**cron** and **at**)
- LOG\_DAEMON - system daemons without separate facility value
- LOG\_FTP - FTP daemon
- LOG\_KERN - kernel messages
- LOG\_INSTALL - installer subsystem (Mac OS X); falls back to LOG\_USER
- LOG\_LAUNCHD - launchd - general bootstrap daemon (Mac OS X); falls back to LOG\_DAEMON
- LOG\_LFMT - logalert facility; falls back to LOG\_USER
- LOG\_LOCAL0 through LOG\_LOCAL7 - reserved for local use
- LOG\_LPR - line printer subsystem
- LOG\_MAIL - mail subsystem
- LOG\_NETINFO - NetInfo subsystem (Mac OS X); falls back to LOG\_DAEMON
- LOG\_NEWS - USENET news subsystem
- LOG\_NTP - NTP subsystem (FreeBSD, NetBSD); falls back to LOG\_DAEMON
- LOG\_RAS - Remote Access Service (VPN / PPP) (Mac OS X); falls back to LOG\_AUTH
- LOG\_REMOTEAUTH - remote authentication/authorization (Mac OS X); falls back to LOG\_AUTH
- LOG\_SECURITY - security subsystems (firewalling, etc.) (FreeBSD); falls back to LOG\_AUTH
- LOG\_SYSLOG - messages generated internally by **syslogd**
- LOG\_USER (default) - generic user-level messages
- LOG\_UUCP - UUCP subsystem

### Levels

- LOG\_EMERG - system is unusable
- LOG\_ALERT - action must be taken immediately
- LOG\_CRIT - critical conditions
- LOG\_ERR - error conditions
- LOG\_WARNING - warning conditions

- LOG\_NOTICE - normal, but significant, condition
- LOG\_INFO - informational message
- LOG\_DEBUG - debug-level message

## DIAGNOSTICS

Invalid argument passed to setlogsock

**(F)** You gave setlogsock() an invalid value for \$sock\_type.

eventlog passed to setlogsock, but no Win32 API available

**(W)** You asked setlogsock() to use the Win32 event logger but the operating system running the program isn't Win32 or does not provides Win32 compatible facilities.

no connection to syslog available

**(F)** syslog() failed to connect to the specified socket.

stream passed to setlogsock, but %s is not writable

**(W)** You asked setlogsock() to use a stream socket, but the given path is not writable.

stream passed to setlogsock, but could not find any device

**(W)** You asked setlogsock() to use a stream socket, but didn't provide a path, and Sys::Syslog was unable to find an appropriate one.

tcp passed to setlogsock, but tcp service unavailable

**(W)** You asked setlogsock() to use a TCP socket, but the service is not available on the system.

syslog: expecting argument %s

**(F)** You forgot to give syslog() the indicated argument.

syslog: invalid level/facility: %s

**(F)** You specified an invalid level or facility.

syslog: too many levels given: %s

**(F)** You specified too many levels.

syslog: too many facilities given: %s

**(F)** You specified too many facilities.

syslog: level must be given

**(F)** You forgot to specify a level.

udp passed to setlogsock, but udp service unavailable

**(W)** You asked setlogsock() to use a UDP socket, but the service is not available on the system.

unix passed to setlogsock, but path not available

**(W)** You asked setlogsock() to use a UNIX socket, but Sys::Syslog was unable to find an appropriate an appropriate device.

## Event Log

Windows Event Log,  
[http://msdn.microsoft.com/library/default.asp?url=/library/en-us/wes/wes/windows\\_event\\_log.asp](http://msdn.microsoft.com/library/default.asp?url=/library/en-us/wes/wes/windows_event_log.asp)

## AUTHORS & ACKNOWLEDGEMENTS

Tom Christiansen <[tchrist@perl.com](mailto:tchrist@perl.com)> and Larry Wall <[larry@wall.org](mailto:larry@wall.org)>.

UNIX domain sockets added by Sean Robinson <[robinson\\_s@sc.maricopa.edu](mailto:robinson_s@sc.maricopa.edu)> with support from Tim Bunce <[Tim.Bunce@ig.co.uk](mailto:Tim.Bunce@ig.co.uk)> and the `perl5-porters` mailing list.

Dependency on `syslog.ph` replaced with XS code by Tom Hughes <[tom@compton.nu](mailto:tom@compton.nu)>.

Code for `constant()`s regenerated by Nicholas Clark <[nick@ccl4.org](mailto:nick@ccl4.org)>.

Failover to different communication modes by Nick Williams <[Nick.Williams@morganstanley.com](mailto:Nick.Williams@morganstanley.com)>.

Extracted from core distribution for publishing on the CPAN by Sébastien Aperghis-Tramoni <[sebastien@aperghis.net](mailto:sebastien@aperghis.net)>.

XS code for using native C functions borrowed from `Unix::Syslog`, written by Marcus Harnisch <[marcus.harnisch@gmx.net](mailto:marcus.harnisch@gmx.net)>.

Yves Orton suggested and helped for making `Sys::Syslog` use the native event logger under Win32 systems.

Jerry D. Hedden and Reini Urban provided greatly appreciated help to debug and polish `Sys::Syslog` under Cygwin.

## BUGS

Please report any bugs or feature requests to `bug-sys-syslog` (at) `rt.cpan.org`, or through the web interface at <http://rt.cpan.org/Public/Dist/Display.html?Name=Sys-Syslog>. I will be notified, and then you'll automatically be notified of progress on your bug as I make changes.

## SUPPORT

You can find documentation for this module with the `perldoc` command.

```
perldoc Sys::Syslog
```

## LICENSE

This program is free software; you can redistribute it and/or modify it under the same terms as Perl itself.

Notes for the future maintainer (even if it's still me..) - - - - -

Using Google Code Search, I search who on Earth was relying on `$host` being public. It found 5 hits:

\* First was inside Indigo Star Perl2exe documentation. Just an old version of Sys::Syslog.

\* One real hit was inside DalWeathDB, a weather related program. It simply does a

```
$Sys::Syslog::host = '127.0.0.1';
```

- <http://www.gallistel.net/nparker/weather/code/>

\* Two hits were in TPC, a fax server thingy. It does a

```
$Sys::Syslog::host = $TPC::LOGHOST;
```

but also has this strange piece of code:

```
# work around perl5.003 bug
sub Sys::Syslog::hostname {}
```

I don't know what bug the author referred to.

- <http://www.tpc.int/> - <ftp://ftp.tpc.int/tpc/server/UNIX/> - <ftp://ftp-usa.tpc.int/pub/tpc/server/UNIX/>

\* Last hit was in Filefix, which seems to be a FIDOnet mail program (!). This one does not use \$host, but has the following piece of code:

```
sub Sys::Syslog::hostname
{
    use Sys::Hostname;
    return hostname;
}
```

I guess this was a more elaborate form of the previous bit, maybe because of a bug in Sys::Syslog back then?
